ACKNOWLEDGMENTS

The 1965-66 nationwide survey of household food consumption was conducted by the Consumer and Food Economics Research Division, Agricultural Research Service, U.S. Department of Agriculture. The sample was designed and the data were collected and processed by National Analysts, Inc., under contract with the Department. The data were tabulated by the General Electric Company, also under contract with the Department.

The study was carried out under the general direction of Faith Clark, Director of the Consumer and Food Economics Research Division, Agricultural Research Service. Work on the survey was the concern of many individuals in the Division. Sadye F. Adelson, formerly Chief, Food Consumption Branch, and Evelyn Grossman, Chief, Survey Statistics Staff, had major responsibility for planning and supervising the study. Elizabeth Davenport, Ennis C. Blake, and Lillian Fincher were responsible for monitoring the technical subject matter aspects of the data

processing and tabulation performed by the contractors. Corinne LeBovit supervised the development of plans for coding and tabulating the data.

This report was written by Sadye F. Adelson and Betty Peterkin. Others who participated in analyzing the findings and writing the report were Dorothy A. Baker, Arletta Beloian, Jessie Brooks, Carolyn Hoge, and Constance Ward. Daniel A. Swope, who succeeded Sadye F. Adelson after her retirement in March 1968, reviewed the manuscript and coordinated the preparation of the report for publication.

Many potential users of data were invited during the planning of the survey to make their needs known and to contribute their ideas. To this end special attention was given by staff members of the Economic Research Service, the Statistical Reporting Service, and the Consumer and Marketing Service, all of the U.S. Department of Agriculture, as well as staff members of other Federal agencies.

DIETARY LEVELS OF HOUSEHOLDS IN THE UNITED STATES, SPRING 1965

By Consumer and Food Economics Research Division
Agricultural Research Service

HIGHLIGHTS

- Amounts of food used in U.S. households were sufficient, on the average, to provide diets meeting the Recommended Dietary Allowances set in 1963 by the National Academy of Sciences—National Research Council for calories and protein; for the minerals—calcium and iron; and the vitamins—vitamin A value, thiamine, riboflavin, and ascorbic acid. There was great variation, however, in the amounts of foods used by different households.
- Ninety percent or more of all household diets supplied the recommended allowances for protein, iron, thiamine, and riboflavin.
- Half of the households had diets that met allowances for all the nutrients studied. These diets were rated "good."
- The nutrients most often below allowances were calcium, vitamin A, and ascorbic acid. Thirty percent of the diets supplied less than the allowance for calcium and about 25 percent, less than the allowances for vitamin A and ascorbic acid. These nutrient shortages were associated with use of less-than-recommended amounts of milk and milk products and vegetables and fruit.

- About one-fifth, or 21 percent, of the households had diets that supplied less than two-thirds of the recommended allowances for one or more nutrients. These diets were rated "poor." The occurrence of poor diets is not necessarily synonymous with hunger and malnutrition.
- Similar percentages of urban and rural households had good and poor diets.
- At each successively higher level of income, a greater percentage of households had good diets; but high income alone was no assurance of good diets. Among households with incomes of \$10,000 and over, 9 percent had poor diets, while 36 percent with incomes under \$3,000 had poor diets.
- Fewer households had good diets in 1965 than in 1955–50 percent in 1965 compared with 60 percent in 1955. The proportion with poor diets increased from 15 to 21 percent over the 10-year period. Decreased use of milk and milk products and vegetables and fruit, the main sources of calcium, ascorbic acid, and vitamin A value, was chiefly responsible for these changes.

INTRODUCTION

This report on the nutritive value of household diets presents data for spring 1965 from the nationwide survey of food consumption made by the U.S. Department of Agriculture from April 1965 through March 1966. Nutrient levels given in this report are calculated from information on the kinds and quantities of food reported used by households. Food consumption information is shown in detail in Report No. 1 of this series (5) and summarized in this report.¹

Information on food consumption and dietary levels serves many needs.

- Congress, the Department of Agriculture, and other Federal agencies use these data in the development and administration of public programs and policies that relate to the production, marketing, regulation, and distribution of food.
- Research and development laboratories, food manufacturers, and food

industries use these data to help interpret the needs and wants of consumers.

- Nutritionists, home economists, educators, and welfare workers use these data to help determine the need for educational programs, to identify the groups that such programs should serve, and to provide a basis for the development of materials and programs for guiding households and individuals in their food selection.

Thus, nationwide food consumption surveys are benchmarks to measure past progress and to point to future programs, developments, and policies that will benefit the consumer.

From the results of this survey, it is possible to appraise and compare the dietary situation among various population groups in the United States. The findings identify by region, urbanization, and income the groups of households that had a large percentage of good and poor diets as defined for this survey. Tabular

¹ Italic numbers in parentheses refer to Literature Cited, p. 114.

data in this report can be used to evaluate diets by other definitions of quality. Biochemical and medical examinations, which would be required to determine the extent of malnutrition among individuals in households, were not a part of this study.

The analysis of the data as summarized in the section on Results is only a part of what is possible. Additional information on the quantities of foods used, the average nutritive value of diets, and the distribution of household diets by level of nutrients is presented in the tables. Tables show unrounded averages and percentages for 12 income classes to allow the greatest flexibility for persons wishing to make additional analysis. Variance data for some statistics in this report are being computed.

To obtain information on the Nation's dietary situation, the Department has made five nationwide surveys of food consumption over the past 30 years—in 1936, 1942, 1948 (urban only), 1955, and 1965-66. Unlike the earlier surveys, data from the 1965-66 study will be available for four seasons. Approximately 7,500 housekeeping households of one or more members were interviewed in the spring of 1965, and 2,500 households were surveyed in each of the following three seasons (summer 1965, fall 1965, and winter 1966).

Data were collected on amounts of food eaten by individuals, in addition to the total household consumption, in the spring of 1965. Thus, information on the food intake and nutritive value of the diets of men, women, boys, girls, and infants is available for the first time on a nationwide basis.

Households were selected to represent housekeeping households in each of the four Census regions during each of the four seasons. Metropolitan areas, cities of various sizes, and rural farm and nonfarm areas were surveyed. To permit

Amounts of food used in U.S. households in the spring of 1965 were sufficient, on the average, to provide diets meeting the Recommended Dietary Allowances set in 1963 by the Food and Nutrition Board of the National Academy of Sciences-National Research Council for calories and protein; for the minerals—calcium and iron; and for vitamins—vitamin A value, thiamine, riboflavin, and ascorbic acid (3).

Averages, however, conceal the great variation in the amounts of food used by different households. One-half the households had diets that furnished the recommended allowances for all the nutrients studied, while diets of the other half failed to meet the allowances for one or more nutrients. Ninety percent or more of the diets supplied the recommended allowances for protein, iron, thiamine, and

adequate farm coverage, farm-operator households were oversampled. Persons living on military reservations, in institutions, and in rooming and boarding houses were excluded. A more detailed description of the sample design and its analysis is presented in "Food Consumption of Households in the United States, Spring 1965" (5).

Experienced interviewers collected the data by personal interview with a knowledgeable household member, usually the homemaker. They used a detailed food list to help the homemaker recall the kinds, quantities, and costs of foods (including alcoholic and other beverages) used at home during the 7 days preceding the interview as well as a count of meals eaten at home and away from home by each household member. Expenditures for meals and snacks away from home paid for by family members were also obtained. In addition to family income, other household data, including the age, education, and employment of the homemaker, were collected for classification purposes. Households in the spring sample were also asked about the kinds of food that were home produced and home preserved during 1964. Households in the winter sample were asked about the use of fat on beef and pork consumed during the survey week.

As in earlier USDA surveys, quantities of most foods were reported in the form in which they came into the kitchen. Thus, the data in these reports are based on economic consumption rather than quantities of foods eaten. Nutrients in the food reported used during the week were calculated from tables of food composition, mostly those in Agriculture Handbook 8 (7). Table 2 in Handbook 8, "Nutrients in the edible portion of one pound of food as purchased," was the principal table used. Estimates of average losses of vitamins during cooking were deducted from food composition values before they were applied to the food quantities. Because of discards of edible food in preparation and as table waste, the calorie and nutrient levels of food eaten were probably below the levels calculated.

RESULTS

riboflavin; nearly 75 percent for vitamin A value and ascorbic acid; and 70 percent for calcium (fig. 1).²

One-fifth of the diets supplied less than two-thirds of the allowances for one or more nutrients. Only 1 or 2 percent of the diets supplied less than two-thirds of the allowances for protein, iron, thiamine, and riboflavin; 8 percent for calcium; 10 percent for vitamin A value; and 13 percent for ascorbic acid.

² The 1968 revision of the Recommended Dietary Allowances was released after this report was prepared. More households in this study would have met the 1968 allowances than the 1963 allowances for protein and ascorbic acid; fewer for iron, thiamine, and riboflavin; and about the same number for calcium and vitamin A value.

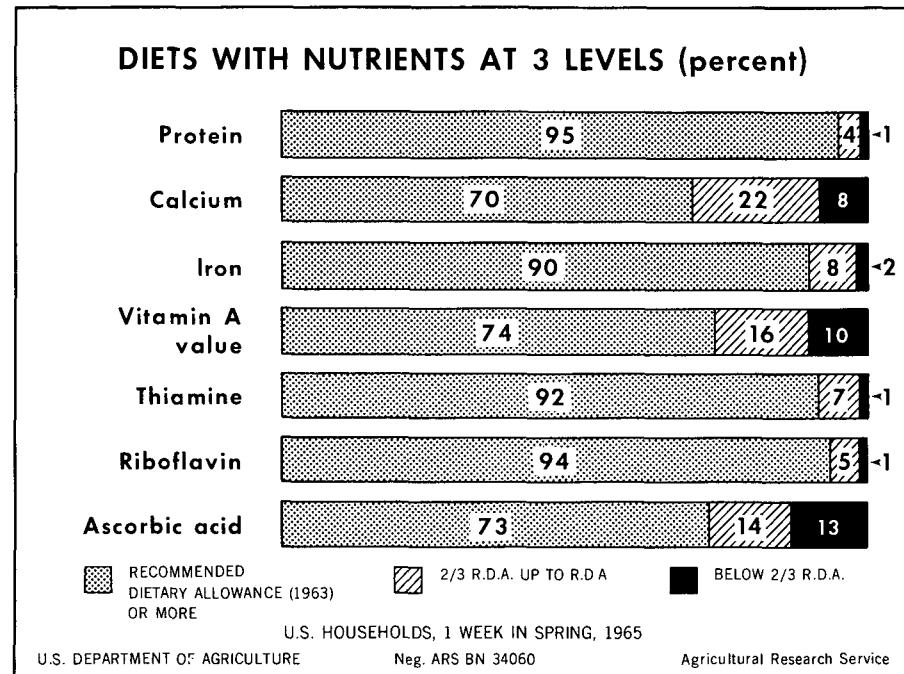

Figure 1

The nutrient shortages were associated with the use of less-than-recommended amounts of milk, vegetables, and fruit—the principal food sources of calcium, vitamin A value, and ascorbic acid. On the average, about 60 percent of the calcium in the diets was supplied by milk and milk products, while 50 percent of the vitamin A value and 90 percent of the ascorbic acid were supplied by vegetables and fruit.

Basis for Evaluation of Diets

The Recommended Dietary Allowances are daily calorie and nutrient intakes judged by scientists of the Food and Nutrition Board to be adequate for maintaining good nutrition in essentially all healthy persons in the United States under current conditions of living. The allowances provide a margin of sufficiency above average physiological requirements for each nutrient, but not for calories, to cover variations in needs among individuals. The Food and Nutrition Board cautions, "It should not be assumed that food practices are necessarily poor or malnutrition exists because the recommendations are not completely met." There is no way to relate the findings from the food consumption study directly to malnutrition and the health of Americans. Nutritional status of groups or individuals must be judged on the basis of physical, biochemical, and clinical observations.

The Food and Nutrition Board states that the allowances are intended to serve "as guides for the interpretation of food consumption records of groups of people." In the study reported here, they have been considered as reasonable benchmarks to make comparisons among population groups and to indicate trends in dietary quality. Their use has been limited to evaluating diets of groups of persons—those in households, those in income classes, and those in regional and urbanization groups.

In this survey, a diet was rated good if the nutritive value of the total food brought into the kitchen for use by the household during the week equaled or exceeded the total allowance for each of seven nutrients for all persons eating from the household food supply. A diet was rated poor if it supplied less than two-thirds of the allowances for one or more nutrients. Two-thirds of the allowance has been considered in this and other household surveys of the Department as a level below which diets could be nutritionally inadequate for individuals over an extended period of time. Between the households with good and poor diets were those with diets that provided at least two-thirds of the allowances for all seven nutrients and less than the allowance for at least one nutrient. Such diets were labeled "fair."

Information was collected on food used from only the home food supply during the week. In rating diets of households, an adjustment was made for food eaten away from home by comparing the nutritive value of food at home with the proportion of the recommended allowance for household members represented by their meals at home. A rating determined in this way assumes that a meal eaten away had the same average nutritive value as a meal eaten at home. For a detailed explanation of the rating of diets, see Definitions and Explanations, "Household Size in Equivalent Nutrition Units."

As indicated earlier, the nutritive value of the household food supply used in rating diets included not only values of foods eaten by household members but also edible foods that were discarded in the kitchen and at the table. Therefore, this report probably overestimates the number of household diets that met allowances. No information was obtained on how food was distributed among family members. Unless it was divided according to nutritional need, some members of the family might not have had diets that met allowances even though the household diet was rated good. On the other hand, if the household food supply did not provide the total allowances of the family, some, if not all, members had diets that did not meet allowances.

Data from this study show that many households in 1965 selected foods that provided the allowances. When allowances were not met, the nutrient shortages could have been corrected by a better selection of food. Failure to meet the allowances should not be interpreted as need for indiscriminate fortification of foods with vitamins and minerals or self-prescribed supplementation of individual diets. Results do imply the need for expanded efforts in nutrition education.

Awareness of foods that make up a good diet, a desire to choose these foods, and sufficient money to buy adequate food must become more universal if most U.S. households are to have good diets.

Differences by Urbanization

About the same proportion, one-half, of the rural nonfarm, the rural farm, and the urban households had diets that met the allowances for all seven nutrients (fig. 2). Also, about a fifth of each of these groups—21 to 23 percent—had diets that were rated poor.

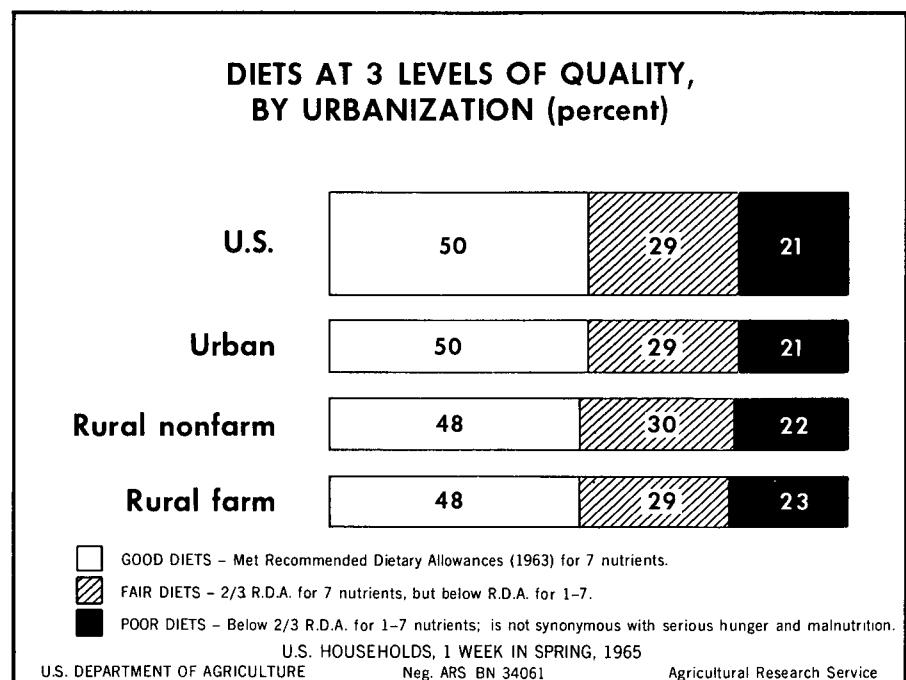

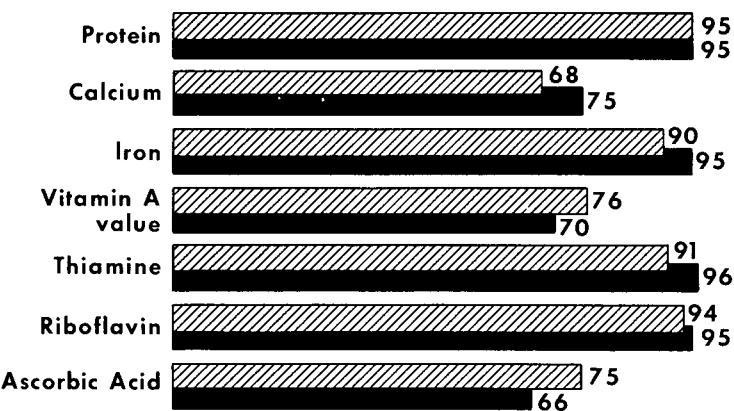

Figure 2

Slightly more urban than farm families had diets that met the allowances for vitamin A value and ascorbic acid (fig. 3). Urban families' greater use of dark-green and deep-yellow vegetables, rich in vitamin A value, and citrus fruits, rich in ascorbic acid, contributed to these differences.

On the other hand, slightly more farm than urban families had diets that met the calcium, iron, and thiamine allowances. Slightly greater use of milk, cream, and

Figure 3

cheese by farm than urban families (4.20 compared with 4.05 quarts, calcium equivalent, per person per week) and much greater use of grain products (3.44 compared with 2.46 pounds, flour equivalent) accounted for this. Proportions of rural nonfarm families with diets meeting the allowances for these three nutrients were between those of urban and farm families.

Money value of food used per person per week in urban households, \$9.09, was slightly higher than in rural nonfarm, \$8.18, and rural farm households, \$7.98.

A dollar's worth of food in farm diets provided substantially more of all nutrients except vitamin A value and ascorbic acid than a dollar's worth of food in urban diets. This difference resulted from the greater use of some inexpensive sources of nutrients—grain products, dry beans, and eggs—by farm households and from their obtaining some foods, such as eggs, chicken, and butter, at lower cost than urban households. That farm diets provided no more vitamin A value and ascorbic acid than urban diets per dollar's worth of food reflected the smaller amounts used of dark-green and deep-yellow vegetables and vitamin C-rich fruits per food dollar by farm families. Nutrients furnished by a dollar's worth of food

(food bought at prices reported by households, and foods home produced or received as gift or pay valued at local retail prices):

Urbanization	Food energy	Protein	Calcium	Vitamin A value	Ascorbic acid
	Cal.	G.	Mg.	I.U.	Mg.
Urban	2,410	81	840	5,920	81
Rural nonfarm.....	2,830	89	980	5,550	81
Rural farm	3,180	98	1,060	5,900	79

Differences by Income

All Urbanizations

Dietary adequacy, measured by the percentage of diets meeting the allowances for all seven nutrients, was related to family income. At successively higher levels of income, a greater percentage of households had diets that met the allowances (fig. 4).

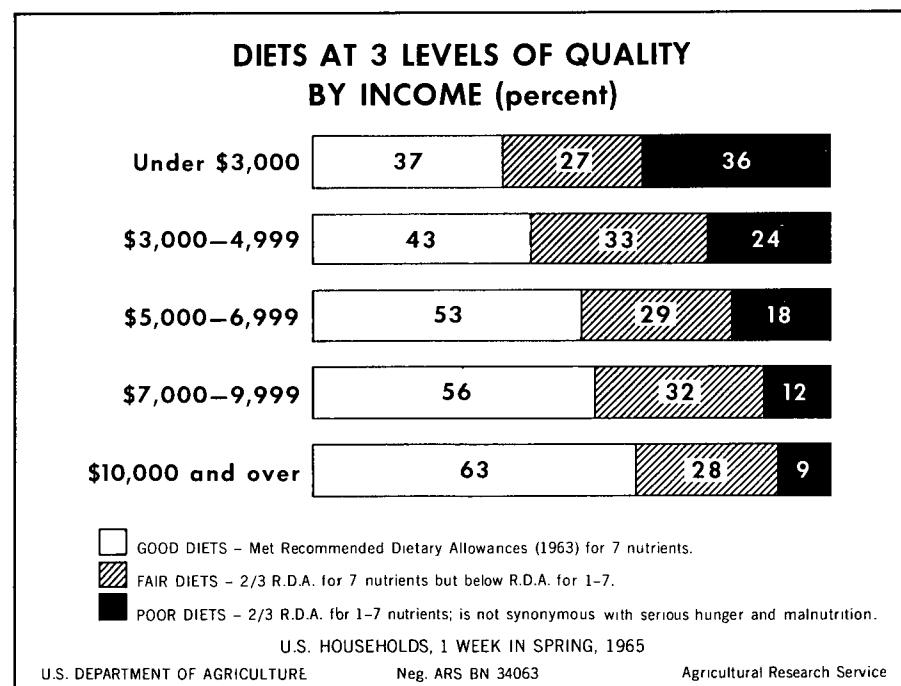

Figure 4

High income alone did not insure good diets. More than a third of the households with incomes of \$10,000 and over had diets below the allowances for one or more nutrients. Nearly a tenth had diets that provided less than two-thirds of the allowances for one or more nutrients.

Of the households with incomes under \$3,000, 37 percent had good diets. Some low-income households spent much more per person for food than others. About a third of the households with incomes under \$3,000 used food valued at more than \$9 per person per week and another third at less than \$6.

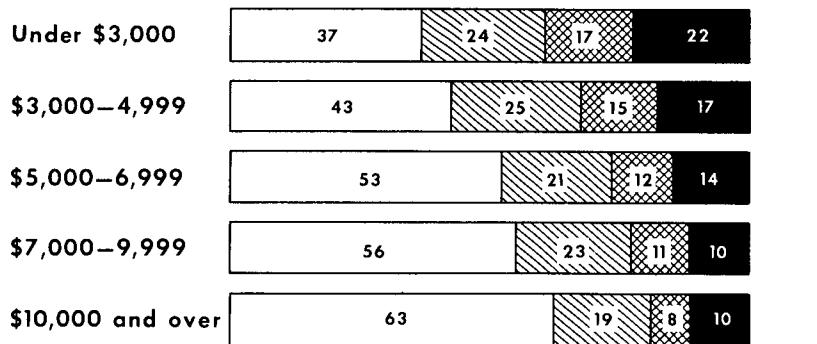

The size of the household and the age of its members affect both the food needed to meet recommended allowances and the money available for buying it. For example, the food needs of an elderly couple are smaller than those of a young couple with several children. Needs of a small family for items other than food are usually less than those of a larger family, leaving more of the money income of the small family for food purchases.

Some low-income households had diets that met allowances because they had access to additional food from home production, received free food through commodity distribution or food stamp programs, or received food as gift or pay. Some households may have had other types of nonmoney income that made it possible for them to spend an unusually large proportion of their money income for food.

Another measure of the relative quality of diets is the number of nutrients that were below the allowances. The percentages of diets with only one nutrient below the allowances were only slightly different when compared by income (fig. 5). However, those with two and with three or more nutrients below were twice as large at the lowest income level as at the highest.

Calcium, vitamin A value, and ascorbic acid were the nutrients most often below allowances in diets of households at all incomes. As income increased, the proportions of diets that were below the allowances declined less sharply for calcium and vitamin A value than for ascorbic acid. Households with incomes of under \$3,000 used 20 percent less milk, cream, and cheese per person and about 40 percent more grain products than the \$10,000 and over income group. Grain products contributed substantially to calcium in diets of many low-income households, particularly those using large amounts of self-rising flour and self-rising cornmeal. Low-income households used a fourth less vegetables and fruit, but as much of the dark-green and deep-yellow vegetables, which are good sources of vitamin A value, as the highest income group. They used less than half as much citrus and other vitamin C-rich fruit as the high-income households. Households at

various levels of income with diets below recommended allowances for calcium, vitamin A value, and ascorbic acid.

Income	Diets below allowances for—		
	Calcium	Vitamin A value	Ascorbic acid
Pct.	Pct.	Pct.	
Under \$3,000	36	36	42
\$3,000-\$4,999	35	26	33
\$5,000-\$6,999	29	24	24
\$7,000-\$9,999	26	20	20
\$10,000 and over	24	18	12

Some differences in the kinds of foods used at different income levels resulted from household characteristics other than income. For example, larger proportions of low- than high-income households lived on farms and were from the South. Families with low incomes were smaller, on the average, and included a larger proportion of elderly persons than those with high incomes. Furthermore, some families have incomes that fluctuate from year to year, and such families tend to maintain their usual food patterns even though their incomes fluctuate. In the survey, households reporting temporarily high or low income probably continued to use kinds and quantities of food typical of their usual food patterns.

Low-income households had greater returns in calories and most nutrients per food dollar, on the average, than high-income households. Returns in ascorbic acid were about the same for all incomes. Nutrients furnished by a dollar's worth of food and money value of food, by income:

Income	Food energy	Protein	Cal-cium	Vitamin A value	Ascorbic acid	Money value of food per person per week ¹
	Cal.	G.	Mg.	I.U.	Mg.	Dol.
Under \$3,000	3,150	99	1,090	6,860	85	6.93
\$3,000-\$4,999	2,860	92	970	6,320	80	7.74
\$5,000-\$6,999	2,570	85	890	5,990	81	8.78
\$7,000-\$9,999	2,380	79	830	5,320	80	9.66
\$10,000 and over	2,100	72	750	5,180	82	11.02

¹ Includes food bought at prices reported by households, and foods home produced or received as gift or pay (including federally donated) valued at retail prices.

A higher average return in nutrients per food dollar for low-income families may not necessarily mean they consciously chose more nutritious foods than families with high incomes. Low-cost diets usually include some foods that are bought in large quantities for a relatively small amount of money. Several of these foods—such as enriched flour and bread, some cereals, dry beans, and potatoes—furnish substantial amounts of certain nutrients. A small part of the food used by the low-income families—representing about 3 percent of total calories—was federally donated. In general, donated foods are those that give high nutrient return per dollar of value.

Despite the high nutrient returns for their food dollars, low-income families more often than higher income families had diets that did not meet allowances, partly because they did not spend as much for food.

Urban and Rural

The percentage of good diets generally increased as income increased for both urban and rural households.

Income	Diets meeting allowances		
	Urban	Rural nonfarm	Rural farm
Pct.	Pct.	Pct.	
Under \$3,000	39	34	38
\$3,000-\$4,999	43	42	48
\$5,000-\$6,999	54	51	57
\$7,000-\$9,999	56	58	56
\$10,000 and over	62	71	64

In households with incomes under \$3,000, about the same percentage of diets of urban, rural nonfarm, and rural farm were rated poor. In these households, diets were most often below two-thirds allowances in ascorbic acid, vitamin A value, and calcium, in that order.

Urbanization	Diets of households with incomes under \$3,000 below 2/3 allowances for—			
	1 to 7 nutrients	Calcium	Vitamin A value	Ascorbic acid
All	Pct.	Pct.	Pct.	Pct.

Comparison With 1955

All Urbanizations

Food used.—Average amounts of some foods used in the spring of 1965 were appreciably different from the amounts used in the spring of 1955, when the USDA made a similar nationwide food consumption survey. The following tabulation shows the consumption of foods grouped according to their nutritional contribution for the 2 years. A more detailed listing of foods with quantities used and money value for 1955 and 1965, grouped by their marketing categories, is shown in table 28 of Report 1 (5).

Among the differences in the two surveys was the increased use in 1965 of two groups of foods—meat, poultry, and fish; and soft drinks, punches, and prepared desserts—and the decreased use of five—milk, cream, and cheese; vegetables and fruit; grain products; fats and oils; and sugar, sirup, jelly, and candy. Within these groups, however, usage of all foods did not change in the same direction. For example, use of pork and fish decreased, and nonfat dry milk, cheese, ice cream, commercially canned and frozen vegetables, bakery products other than bread, ready-to-eat cereals, oils, and candy increased.

Food group	Quantity per person per week ¹		Change from 1955
	1955	1965	
Milk, cream, cheese (milk equivalent) ²	9.57	8.76	-8
Meat, poultry, fish, and other protein foods ³	5.23	5.69	+9
Meat, poultry, fish	4.14	4.58	+11
Eggs (fresh equivalent)84	.82	-2
Mature legumes (dry weight)15	.17	+13
Peanut butter and nuts (shelled weight)09	.12	+33
Vegetables and fruit ²	9.94	9.09	-9
Potatoes (fresh equivalent)	1.93	1.90	-2
Dark green, deep yellow59	.48	-19
Tomatoes79	.76	-4
Citrus (single-strength juice equivalent)	1.27	1.22	-4
Grain products (flour equivalent) ²	2.84	2.65	-7
Enriched (flour equivalent)	2.10	2.08	-1
Fats, oils89	.83	-7
Sugar, sirup, jelly, candy	1.25	1.12	-10

Alcoholic beverages	⁴ .52	.68	+31

¹ 21 meals from home supplies equal 1 person.

² Includes mixtures and soups with main ingredient from group.

³ Excludes mixtures, soups, and plate dinners.

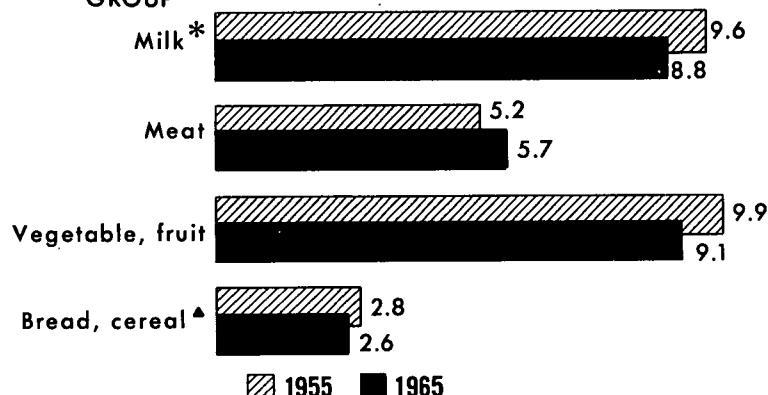

⁴ Estimate based on money value of alcoholic beverages purchased during the week in 1955.

Figure 6 shows food use in the four major nutrition groups for the two survey periods.

The food dollar.—The average money value of food used at home (expenditures for purchased food plus money value of nonpurchased food) was 16 percent higher in 1965, \$8.79 per person, than in 1955, \$7.56. During this decade, city prices for food used at home, as measured by the Bureau of Labor Statistics Consumer Price Index (CPI), rose 13 percent. Apparently, households surveyed in 1965 spent enough for food to obtain diets that could have been similar to those of survey households in 1955. Smaller proportions of each food dollar in 1965, however, were used for some of the economical sources of nutrients. For example, less of each dollar in 1965 than in 1955 was used for milk and milk products, the most economical food sources of calcium. More of each dollar in 1965 went for soft drinks, punches, ades, and alcoholic beverages—foods that usually provide little nutrient return for the money spent. Less of each dollar was used for flour and bread—usually relatively inexpensive nutrient sources—in 1965 than a decade

**FOOD USE PER PERSON

earlier, but more was used for bakery products other than bread. Slightly more of each dollar in 1965 went for meat, poultry, and fish.

The division of the food dollar (expenditures for purchased food plus money value of nonpurchased food) used by survey households in the spring of 1955 and spring 1965 follows:

Food group ¹	1955	1965
	Cents	Cents

¹ Mixtures and soups included with group of main ingredient, except those mainly meat which are included with other protein foods.

² Includes all plate dinners.

Nutritive value of foods used.—Differences in food patterns were reflected in the average nutritive value of diets for the two periods. The use of more meat, poultry, and fish was a major factor in providing slightly higher levels of protein and iron in diets in 1965 than in 1955. The use of smaller amounts of vegetables, particularly the dark-green and deep-yellow varieties, and fruit accounted for less vitamin A value and ascorbic acid in diets. Calcium and riboflavin levels were lower in 1965 than in 1955 mainly because of lower consumption of milk and, to a lesser degree, lower consumption of grain products.

The data on the nutritive content of the 1955 diets were adjusted to make them comparable with the 1965 data. Amounts of the key nutrients per person in 1955 were adjusted (1) to reflect revisions of values in food composition tables made since the 1955 survey, and (2) to include nutritive values for alcoholic beverages, coffee, and baking powder. Comparable values for spring 1955 and spring 1965 and the percentage changes follow:

Nutrient	Value per person per day ¹		Change from 1955
	1955 ²	1965	
<i>Percent</i>			
Food energy cal.	3,220	3,210	*
Protein g.	103	106	+3
Fat g.	154	154	0

Riboflavin mg.	2.50	2.38	-5
Ascorbic acid mg.	108	101	-6

¹ 21 meals from home supplies equal one person.

² Adjusted to include (1) revisions in food composition values made since 1955 and (2) nutritive values for alcoholic beverages, coffee, and baking powder.

*Less than 0.5 percent.

Percentage of diets meeting allowances.—To compare the proportions of households with diets meeting the allowances for the two periods, further adjustments were made to the 1955 survey data to reflect the 1963 revision of the Recommended Dietary Allowances. Estimates were made of the percentage of diets surveyed in 1955 that met the 1963 allowances and the percentage that did not two-thirds of the 1963 allowances.

In both 1955 and 1965, fewer diets met the allowances for calcium, vitamin A value, and ascorbic acid than for other nutrients. In 1965 the proportions of diets meeting allowances for these three nutrients were somewhat lower than in 1955. In addition, more of them were below two-thirds of the allowance for these nutrients than in the earlier period. Estimates of households surveyed in the spring of 1955

and 1965 with diets providing allowances (1963) and less than two-thirds allowances follow:

Nutrient	Diets providing—			
	Allowances		Less than two-thirds allowances	
	1955 ¹	1965	1955 ¹	1965
Pct.	Pct.	Pct.	Pct.	
All 7 nutrients.....	60	50	—	—
1 to 7 nutrients.....	—	—	15	21
Protein.....	93	95	1	1
Calcium.....	79	70	5	8
Iron.....	90	90	1	2
Vitamin A value.....	80	74	6	10
Thiamine.....	94	92	1	1
Riboflavin.....	95	94	1	1
Ascorbic acid.....	76	73	10	13

¹ Adjusted to be comparable with 1965 data. See Definitions and Explanations, "Revisions of 1955 Survey Data." Figures have been rounded independently.

Good diets—those meeting allowances for all seven nutrients—were found in 50 percent of the households surveyed in 1965 and in 60 percent in 1955 (fig. 7). Twenty-one percent of the diets in 1965 and 15 percent in 1955 were poor in that they provided less than two-thirds of the allowances for one or more of the nutrients.

Urban and Rural

Food used.—Shifts in food use between 1955 and 1965 occurred in all urbanization groups. Most notable shifts, however, were by farm households whose food patterns were more like those of urban households in 1965 than in 1955.

In 1965, urban, rural nonfarm, and rural farm households used less fresh fluid milk than they used in 1955, resulting in a decline for the milk, cream, and cheese group for each urbanization class. Farm households, the class that used the most milk per person in 1955, showed the greatest percentage decline. Even so, in 1965 they still used slightly more milk than urban households.

In 1965 milk per person produced at home by farm households was less than half that produced in 1955—3.4 compared with 7.5 pounds per person per week. This difference more than accounted for the decrease in total use of milk by all farm households, whether or not they used any home-produced milk, cream, and cheese. From 1955 to 1965, milk equivalent per person dropped from 11.1 to 9.0 pounds. Fewer than 40 percent of the farm households used some home-produced milk during the week studied in 1965 compared with 65 percent in 1955.

Rural households used less grain products in 1965 than in 1955. Despite this decrease, both rural farm and rural nonfarm households used more of these foods in 1965 than did urban households.

DIETS AT 3 LEVELS OF QUALITY (percent) 1955 AND 1965

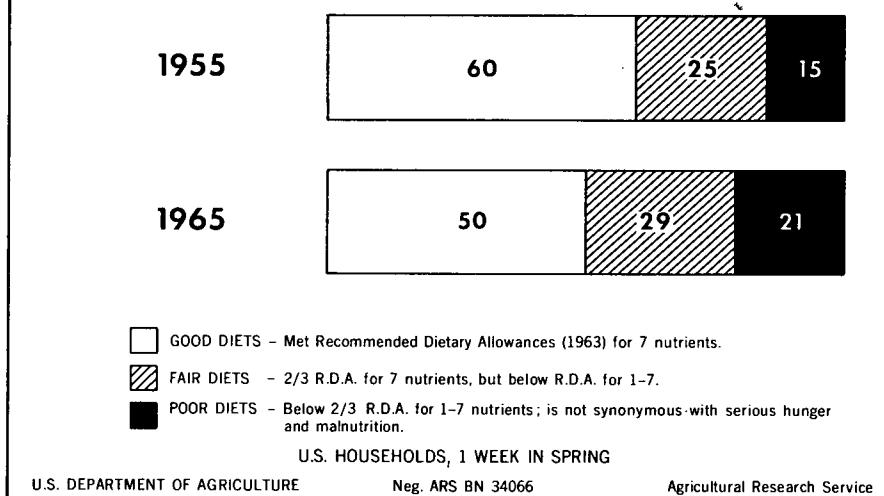

Figure 7

Food group and urbanization	Quantity per person per week ¹		Change from 1955

Rural farm	3.86	3.44	-11

¹ 21 meals from home supplies equal 1 person.

² Includes mixtures and soups with main ingredient from group.

³ Includes dry weight of legumes and shelled weight of nuts; excludes mixtures and soups.

The impact of shifts in the use of the milk and grain groups on the average calcium levels per person per day in diets of urban and farm households is shown in figure 8.

Both urban and rural households used more of the foods in the meat group in 1965 than in 1955. These increases resulted in slightly higher average levels of protein and iron in diets. The amount of home-produced meat used per person by farm households remained about the same for the two survey periods. Approximately two-thirds of these households used some home-produced meat during the week in each year. Home-produced eggs were used by about one-half of the farm households in 1965 and about three-fourths in 1955.

Both urban and rural households used less vegetables and fruit per person in 1965 than in 1955. In each survey, urban households used more vegetables and fruit than their farm counterparts, but the gap was smaller in 1965. Households in each urbanization class used less citrus fruit per person in 1965 than in 1955. Another important change was the smaller amount of dark-green and deep-yellow vegetables used in 1965 than in 1955, particularly by urban households. The reduction in amount used by farm households was almost entirely accounted for by smaller amounts of home-produced items used. Similar quantities of potatoes, on a fresh-equivalent basis, were used in both years by all classes of households. Farm households used as many potatoes per person in 1965 as in 1955 despite a decrease of over one-fourth in the use of home-produced potatoes.

Food and urbanization	1955	1965	Change from 1955
	Pounds	Pounds	Percent
Citrus fruit (single-strength juice equivalent):			
Urban	1.48	1.34	.9
Rural nonfarm.	1.08	.98	-.9
Rural farm82	.74	-10
Dark-green and deep-yellow vegetables:			
Urban68	.52	-24
Rural nonfarm.48	.39	-19
Rural farm47	.40	-15
Potatoes (fresh equivalent):			
Urban	1.79	1.78	-1
Rural nonfarm.	2.11	2.09	-1
Rural farm	2.26	2.34	+4

Nutritive value of food used.—Shifts in the nutritive value of food used between 1955 and 1965 occurred in all urbanization groups. Urban, rural nonfarm, and rural farm households had diets in 1965 that provided slightly more protein and iron and about the same or less of other nutrients than in 1955. Nutritive values of diets of farm households were more like those of urban households in 1965 than in the earlier period. Vitamin A value in diets of rural farm and rural nonfarm households, lower than for urban households in 1955, declined less

between the two survey periods than vitamin A in diets of urban households. On the other hand, calcium and riboflavin values of diets of farm households, relatively high in 1955, declined more over the 10-year period than those of the other urbanization groups. Even with the greater decline, farm diets in 1965 provided more of these two nutrients than diets of rural nonfarm and urban households. Nutritive value of food used by urban and rural households in the spring of 1955 compared with spring 1965 follows:

Nutrient	Nutritive value per person per day, 1955 ¹			Change from 1955 to 1965 ²		
	Urban	Rural nonfarm	Rural farm	Urban	Rural nonfarm	Rural farm
Food energy cal . .	3,080	3,300	3,680	+2	*	-2
Protein g. .	103	101	109	+3	+3	+2
Fat g. .	150	154	168	+1	+1	0
Calcium mg. .	1,180	1,270	1,450	-.8	-.9	-17
Iron. mg. .	18.6	19.3	20.7	+3	+2	+3
Vitamin A value. I.U. .	8,880	7,110	7,270	-13	-.9	-7
Thiamine. mg. .	1.55	1.68	1.86	-1	-4	-5
Riboflavin mg. .	2.46	2.45	2.76	-4	-4	-9
Ascorbic acid mg. .	115	102	96	-9	-7	-6

¹ Adjusted to include (1) revisions in food composition values made since 1955 survey and (2) nutritive values for alcoholic beverages, coffee, and baking powder. 21 meals from home supplies equal 1 person.

² Values for 1965 are shown on pp. 20-21.

*Less than 0.5 percent.

Percentage of diets meeting allowances.—Fewer diets met allowances for calcium, vitamin A value, and ascorbic acid in 1965 than in 1955 in all urbanization groups. The decrease in the proportions meeting the three allowances was slightly greater for urban than rural households. Urban and rural households with diets meeting allowances in spring 1955 and spring 1965 follow:

Nutrient	Urban		Rural nonfarm		Rural farm	
	1955 ¹	1965	1955 ¹	1965	1955 ¹	1965
	Pct.	Pct.	Pct.	Pct.	Pct.	Pct.
All 7 nutrients.	65	50	57	48	58	48
Protein	93	95	93	95	94	95
Calcium	79	68	81	73	83	75
Iron.	89	90	90	91	93	95
Vitamin A value.	84	76	76	71	74	70
Thiamine.	94	91	95	93	98	96
Riboflavin	95	94	94	94	94	95
Ascorbic acid	81	75	72	69	68	66

¹ Adjusted to be comparable with 1965 data. See *Definitions and Explanations*, "Revisions of 1955 Survey Data." Figures have been rounded independently.

Only 1 or 2 percent of both urban and rural households had diets providing less than two-thirds of the allowances for protein, iron, thiamine, and riboflavin in spring 1955 and spring 1965. The percentage of diets below two-thirds of the allowances for the other three nutrients is shown below.

There were fewer good diets and slightly more poor diets in 1965 than 10 years earlier in each urbanization group (fig. 9). Quality of diets declined slightly

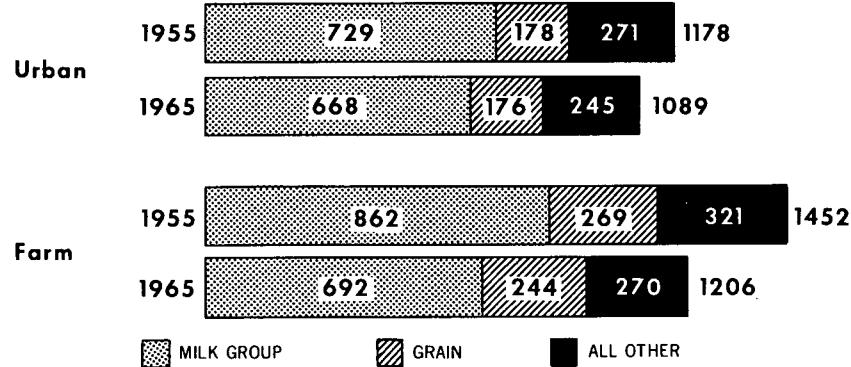

more for urban than rural households. The relationship between the quality of diets and urbanization of households changed over the 10-year period. In 1955 a larger proportion of urban households had good diets and a smaller proportion poor diets than rural households. In 1965, however, proportions of good and poor diets were similar for the three urbanization groups.

GENERAL NOTES ON USE OF TABLES

The following notes contain information and explanations applicable to several tables. In addition, specific table notes, which appear after the tables, refer to a particular table, group of columns, or a single column of a table. Items to which specific notes refer are marked by the symbol ‡ on the table.

1. "All households" include households not classified by income.
2. Component items may not add to totals because of rounding or because the data for one or more component items are not given.
3. Data refer to food used at home during the week from all sources—purchased, home produced, and received as gift or pay; except in tables for the rural farm category showing data for home-produced food used at home during the week.
4. The asterisk (*) indicates some, but less than $\frac{1}{2}$ of the value of 1 in the last digit shown in the column.
5. Cooking losses have been deducted from all vitamin values.
6. Averages per person or per nutrition unit and percentages of households are based on the total count in the cell (tables 3-5, 7-11, and 13-19). See table 1 for cell counts. Percentages in table 12 are based only on households with diets furnishing less than allowances for one or more nutrients.
7. Data in tables 3, 5, and 13-19 are shown as averages *per person*. Twenty-one meals from home food supplies were counted as one person. The use of 21-meal-at-home-equivalent-persons adjusts for those family members who may have eaten meals away from home and nonfamily members who may have eaten from household food supplies. See Definitions and Explanations, "Household Size in Equivalent Meals."
8. Nutritive values of diets in table 4 are shown as averages *per nutrition unit* per day. Also, percentages in tables 7-12 are based on amounts of nutrients per nutrition unit in household diets. Diets of households of different sizes and compositions can be compared when their nutritive values are presented on a nutrition unit basis. See Definitions and Explanations, "Household Size in Equivalent Nutrition Units."
9. Groupings of food in this report, meaningful for nutritional analysis, are not the same as those in Report 1 (5), useful for marketing purposes.
10. Soups and mixtures are shown separately under food groups covering their main ingredients, with one exception. Those mainly meat, poultry, and fish are included in the group, "Other protein food."
11. Plate dinners are not shown separately but are included in totals for food groups covering their main ingredient, with one exception. Those mainly meat, poultry, or fish are included in the group, "Other protein food."
12. Table 19 shows the average money value of food used (21 meals at home) from all sources and the distribution of households having food of specified money value which can be used to indicate variation in total food consumption among households.
13. Data are not necessarily as precise as the amount of detail published may imply. Digits beyond significance are sometimes shown to enable users to regroup data.

† TABLE NOTES ON PAGES 107-109

SPRING 1965

SPECIFIC TABLE NOTES

Table 1.—Number of Households and Household Size

<u>Col. No.</u>	<u>Heading</u>	<u>Notes</u>
2B . . .	Weighted number . . .	Weights were used to compensate for expanded sample of farm households. Farm households have a weight of 1/5 in the Northeast, West, and South; 1/4 in the North Central. For more details, see HFCS 1965-66 Report 1(5).
	Household size in:	
3 . . .	Equivalent persons:	21 meals from home food supplies are equivalent to "one person."

<u>Col. No.</u>	<u>Heading</u>	<u>Notes</u>
4-11 . . .	Equivalent nutrition units:	Household size in adult-male equivalent units (to permit comparison of diets of households of different sizes and composition). For each nutrient the number of such units was calculated using the 1963 Recommended Dietary Allowances to relate the needs of persons of different age and sex to those of the 20-35-year-old man.

Table 2.—Household Composition in Terms of Meals at Home

<u>Col. No.</u>	<u>Heading</u>	<u>Notes</u>
2	Total	Includes refreshments to guests (equated to a meal basis) not included in other columns.
	Percent of total meals at home in a week:	
9	Women, total	Includes nursing mothers, not shown separately.
21	Girls 9-19, total . . .	Includes pregnant and nursing mothers, not shown separately.

Table 5.—Nutritive Value of Diets Per Person by Food Group

<u>Col. No.</u>	<u>Heading</u>	<u>Notes</u>
1	Food group	See notes for tables 13-18 for some, but not necessarily all, items included in food groups.

Table 6.—Money Value and Nutrients by Food Group

<u>Col. No.</u>	<u>Heading</u>	<u>Notes</u>
1	Food group	See notes for tables 13-18 for some, but not necessarily all, items included in food groups.
Tables 7-10.—Percent of Household Diets With Specified Amounts of Nutrient per Nutrition Unit per Day		
<u>Col. No.</u>	<u>Heading</u>	<u>Notes</u>
	Title	The amount in the first interval specified is less than two-thirds of the Recommended Dietary Allowance (1963) for the 25-year-old-man. The amount in the second interval is from two-thirds of the allowance up to the allowance.

Table 12.—Household Diets by Number of Nutrients Below Recommended Allowance (1963)

<u>Col. No.</u>	<u>Heading</u>	<u>Notes</u>
	Percent of diets short in—	
2	1 or more	Percent of diets not meeting allowances for 1 or more nutrients = 100.0. The percent of all diets short in specified numbers of nutrients can be computed by multiplying percents in col. 3-9 by percent of households with less than allowance for one or more nutrients in table 11, col. 2.

Table 13.—Milk, Cream, Cheese

<u>Col. No.</u>	<u>Heading</u>	<u>Notes</u>
2-3	Total (milk equivalent)	Quantity of whole fluid milk to which dairy products (except butter) are equivalent in calcium.
	Milk (fresh, processed)	
3	Total (equivalent) . . .	Includes fresh fluid milk, not shown separately.

Table 14.—Meat, Poultry, Fish; Other Protein Food

Col. No.	<u>Heading</u>	<u>Notes</u>
8	Other meat	Includes veal, lamb, game, and variety meat.
	Other protein food:	
11	Total	**Indicates data are not available. Total for money value includes plate dinners mostly meat, poultry, fish, other protein foods not shown separately.
12	Eggs (fresh equivalent)	Includes in-shell equivalent of liquid (yolks, whites, mixed yolks and whites) and processed eggs.

Table 15.—Vegetables (Fresh, Processed)

Col. No.	<u>Heading</u>	<u>Notes</u>
2,8,14, 19,24,		Vegetable juice is included in this table.
27	Total	Includes fresh produce and small amounts of foods prepared at home prior to the survey week, not shown separately.
	All vegetables:	
2	Total	Sum of unconverted quantities of all components.
8-13 . . .	Potatoes	Includes potato chips, sticks, salad, and soup.
8	Total (fresh equivalent)	Weight of fresh potatoes with skins plus pared and processed potatoes converted to equivalent weight of fresh potatoes with skin.
14-18 . .	Dark green	Includes spinach, kale, collards, mustard greens, broccoli, peppers, and other dark-green vegetables rich in vitamins A and C.
19-23 . .	Deep yellow	Includes sweetpotatoes, carrots, pumpkin, winter squash, and other deep-yellow, vitamin A-rich vegetables.

24-26 . .	Tomatoes	Includes tomato paste, sauce, catsup, soup, and relish.
27-32 . .	Other	Includes olives, pickles, relishes not tomato.
33 . . .	Soup, mixtures:	
	Total	Includes ready-to-eat mixtures not shown separately.

Table 16.—Fruit (Fresh, Processed)

Col. No.	<u>Heading</u>	<u>Notes</u>
		Fruit juice is included in this table.
2,8,13, 16	Total	Includes fresh fruit and small amounts of food prepared at home prior to the survey week not shown separately.
	All fruit:	
2	Total	Sum of unconverted quantities of all components.
	Citrus:	
8	Total (juice equivalent)	Weight of single-strength juice plus equivalent juice of fresh citrus fruit and concentrated citrus juice.
13-15 . .	Other vitamin C rich	Includes cantaloup, papaya, strawberries, and other vitamin C-rich fruits. Excludes melons other than cantaloups and berries other than strawberries.

Table 17.—Grain Products

Col. No.	<u>Heading</u>	<u>Notes</u>
2,7	Total (flour equivalent)	Weight of flour, cereals, meals, and pastes plus dry weight of flour, cereals, meals, and pastes in prepared products and bakery products.

Table 18.—Fats, Oils; Sugars, Sweets; Other Food

Col. No.	<u>Heading</u>	<u>Notes</u>	Other food: 12,15	Total **Indicates data are not available.
	Sugar, sweets:			
8.	Total (sugar equivalent)	Weight of sugar, sirup, jelly, and candy plus sugar equivalent of soft drinks, ades and punches, beverage and dessert powders, and prepared desserts.	14 . . .	Some nutritive value Includes yeast, baking powder, coffee, coffee substitute, tea, cocoa, baking chocolate, chocolate sirup.
10,11 .	Other sweets (sugar equivalent).	Includes sugar equivalent weight of soft drinks, ades, and punches; beverage and dessert powder; and prepared desserts.	15 . . .	No nutritive value Includes vinegar, salt, artificial sweeteners, meat extracts, soya sauce, meat tenderizer, vanilla, other flavorings, pepper, spices, herbs, soda, cream of tartar, similar products.

DEFINITIONS AND EXPLANATIONS

All households.—All households classified by income plus some households not classified by income. Households not classified were those with persons living together but not drawing from a common fund for major expense items, such as food and housing, at the time of the survey or for the year 1964, and households in which respondents were either unable or unwilling to give information about income.

All sources.—Includes food used during the week from the following sources: (1) Bought with cash, credit, food stamps, coupons, or food vouchers; (2) home produced; (3) federally donated; and (4) received as gift or pay; that is, food received as gift from person outside of the household, as payment for services rendered, or received from a private or public welfare agency.

All urbanizations.—See "Urbanization."

Citrus juice equivalent.—Includes weight of single-strength citrus and blended citrus juice plus juice weight of fresh citrus fruit and commercially frozen or canned concentrated citrus fruit juices converted to their equivalent single-strength juice weight. Source of most factors: "Conversion Factors for Agricultural Commodities" (6).

Dietary quality.—An assessment of the nutritive value of foods used at home in relation to the Recommended Dietary Allowances of household members adjusted for the number of meals eaten away from home. A diet was termed good when its nutritive value equaled or exceeded the recommended allowance for each of the seven nutrients for all persons eating in the household. When a diet supplied less than two-thirds of the recommended allowance for one or more nutrients, it was rated poor. Between the households with good and poor diets were those that provided less than the allowance for at least one nutrient but at least two-thirds of the allowance for all seven nutrients. Such diets were sometimes labeled fair. See "Household Size in Equivalent Nutrition Units," and "Recommended Dietary Allowances."

Eggs, fresh equivalent.—Includes dozens of fresh eggs plus frozen, dried, or liquid eggs without shell, whether the whole egg, whites, or yolks only, converted to equivalent amounts of whole eggs in shell on a weight basis. Source of most factors: "Conversion Factors for Agricultural Commodities" (6).

Farm.—See "Urbanization."

Flour equivalent.—The product weight of flour, meal, cereals, and pastes, plus the weight of the dry flour, meal, cereals, and pastes in prepared flour mixes,

bakery products, and other mixtures of which the predominant ingredients were from grain. The flour equivalent of the mixed foods ranged from 20-60 percent of the product weight. Source of most factors: "Conversion Factors for Agricultural Commodities" (6).

Food at home.—Food and beverages (alcoholic and nonalcoholic) used during the 7 days before the date of the survey interview, whether bought or received without direct expenditure. Included were food and beverages (1) eaten at home, (2) carried from home in packed meals, (3) thrown away, and (4) fed to pets. Excluded from food at home were (1) commercial pet food and household food fed to animals raised for commercial purposes and (2) food that was given away for use outside the home, such as food sent to sons in the military service, gifts of food donated to a church supper, and food given to household help to take home.

Food used at home was classified as fresh, canned commercially or at home, frozen commercially or at home, and dried or dehydrated. Generally, the food used at home was classified in the form brought into the kitchen. Homemade mixtures used during the survey week were recorded (1) as ingredients if prepared during the survey week or (2) as the product if prepared before the survey week.

Home-canned food.—A product canned at home before the survey week whether home processed by the respondent or by someone else who gave or sold the canned food to the respondent. Homemade jelly, marmalade, pickles, catsup, relish, and nut butter were considered home canned.

Home-frozen food.—A product frozen at home before the survey week whether home processed by the respondent or by someone else who gave or sold the frozen food to the respondent. To be considered home frozen, a food was frozen and stored in a separate freezer—a home freezer, a combination freezer-refrigerator with freezer sealed off, or a locker in a plant for storing frozen food.

Home-produced food.—Food raised for home use and food obtained by hunting, fishing, and gathering from the wild. Home-canned, home-frozen, and home-baked foods were not included unless the major ingredient was home produced.

Household.—A family or a group of unrelated persons who lived together, and their guests, boarders, and hired help. Included were persons who usually lived there but were away from home temporarily—on vacation, at school, or on a business trip, for example. Food information was not taken from a household unless at least one person had 10 or more meals from the household food supply during the 7 days preceding the interview.

Household size in equivalent meals at home (persons).—The number of 21-meal-at-home-equivalent persons in the household. All meals eaten at home during the week by family members, guests, boarders, or household help were added together and divided by 21. In counting the meals from household food supplies the following procedures were used: (1) When a household member's morning, noon, or evening meals at home and away did not add to seven, skipped meals were assumed to be at home or away in the same proportion as reported meals. (2) Meals by members in addition to three a day and refreshments and snacks were counted as a part of the three meals. (3) Refreshments served to guests (not full meals) were counted as one-fourth or one-half meal depending on the number of items served. (4) Food carried from home supplemented by only beverage from other sources was counted as a home meal. (5) Food carried from home, supplemented by other food, was counted as one-half meal.

Household size in equivalent nutrition units.—The number of adult-male equivalent persons in the household, calculated separately for food energy and each nutrient based on the relative needs of household members. The need of the man, 25 years old as indicated by the Recommended Dietary Allowance (1963), was assumed to be 1.0 nutrition unit. Needs of other persons in equivalent nutrition units were calculated by dividing their allowances by the allowance for the man. For example:

Household member	Daily recommended allowance for—		Equivalent nutrition units	
	Food energy	Calcium	Food energy	Calcium
	Cal.	G.		
Man, age 25	2,900	0.8	1.00	1.00
Woman, age 25	2,100	.8	.72	1.00
Boy, age 9	2,400	1.1	.83	1.38
Girl, age 2	1,300	.8	.45	1.00

The size of the household in equivalent nutrition units was then determined, taking into account the number of meals each person had at home. An example of the calculations for food energy and calcium for one household follows:

Persons served	Meals at home during week	Equivalent nutrition units		Meals X nutrition units	
		Food energy	Calcium	Food energy	Calcium
Household meals:					
Man, age 25	14	1.00	1.00	14.00	14.00
Woman, age 25	18	.72	1.00	12.96	18.00
Boy, age 9	18	.83	1.38	14.94	24.84
Girl, age 2	21	.45	1.00	9.45	21.00
Guest meals, female, age 75	1	.48	1.00	.48	1.00
Total for the week	72	—	—	51.83	78.84

For this household, the size in equivalent nutrition units for food energy is 2.47 ($51.83 \div 21$) and for calcium, 3.75 ($78.84 \div 21$). The household size in 21-meal-at-home equivalent persons is 3.43 ($72 \div 21$).

If standards of dietary quality other than Recommended Dietary Allowances set in 1963 by the Food and Nutrition Board are used, the household size in nutrition units and all tables on a nutrition unit basis should be recomputed.

Milk equivalent.—Quantity of whole fluid milk to which dairy products (except butter) are equivalent in calcium content. Chief source of data on the calcium content of the various diary products: "Composition of Foods" (7).

Money income.—Respondent's estimate of 1964 money income (after deduction of State and Federal income taxes) within one of the income classes, by \$1,000 increments up to \$12,000, and by broader income ranges above \$12,000 up to \$25,000 or more. Income was counted for all persons living in the household who drew from a common fund for the major items of expense, such as food and housing, whether or not they ate at home during the week. Included were unmarried sons and daughters of any age living at home; persons usually a part of the family who were temporarily away from home—at school, at work, in the hospital, or on vacation; and other persons related or unrelated living with the family who drew from a common family fund for major items of expense. Income from sons and daughters quartered on military installations was not included.

Money value of food used at home.—Expenditures for bought food and money value of home-produced food and food received free of cost that was used during the survey week. Expenditures for bought food were based on prices reported as paid regardless of the time of purchase. Sales tax was excluded. Bought food with no price reported, home-produced food, and food received as a gift or instead of pay were valued using prices reported as paid for similar items by other families in the same region and urbanization. Federally donated foods were valued using average retail prices in the United States reported by the Bureau of Labor Statistics for use in its food price index.

Nutrition unit.—See "Household Size in Equivalent Nutrition Units" and "Nutritive Value of Diets Per Nutrition Unit."

Nutritive value of diets.—Nutritive values of all foods and beverages including alcoholic beverages and baking powder used. Nutritive content of food was calculated mainly from data on nutrients in the edible portion of one pound of food as purchased—table 2, "Composition of Foods" (7). Homemakers provided descriptive information with regard to kind, process, inedible parts, and enrichment and fortification for matching foods used with corresponding items in composition tables.

Before the food composition values were applied to the food quantities, estimated average losses in cooking for vitamin A value, thiamine, riboflavin, niacin, and ascorbic acid were deducted. Cooking losses were estimated from "Procedures for Calculating Nutritive Values of Home-Prepared Foods" (2) and unpublished data.

The data include nutritive values of any edible food brought into the kitchen for household use but lost or discarded in storage, in preparation for cooking, and as plate or table waste. Therefore, the amounts of nutrients given in tables of this report are undoubtedly larger than amounts in the food actually eaten. Minerals in water and minerals and vitamins from concentrates taken by individuals were not included.

Nutritive value of diets per nutrition unit.—Nutritive value of food used at home divided by the household size in nutrition units and by seven. See "Household Size in Equivalent Nutrition Units." When content of diets is presented on a unit-of-nutrient-need basis, diets of groups of households of varying size and composition can be compared and such households can be arrayed by the level of the nutrient content of their diets.

An adjustment for meals eaten away from home by family members was made through use of the number of meals at home only in the divisor. This adjustment assumes that an average meal away from home is equal nutritionally to a meal at home. Between-meal food eaten away from home is not included.

Nutritive value of diets per person.—Nutritive value of food used at home divided by the number of 21-meal-at-home-equivalent persons in the household. See "Household Size in Equivalent Meals at Home (Persons)." Nutrient content of diets is presented per 21-meal-at-home-equivalent person to adjust for various sizes of households. An adjustment for meals eaten away from home by family members was made through use of the number of meals at home only in the divisor. This adjustment assumes that an average meal away from home is equal nutritionally to a meal at home. Between-meal food eaten away from home is not included.

Averages per person are generally satisfactory for comparisons among large population groups similar in composition by age and sex. For groups dissimilar in composition, comparisons may be misleading because the food needs of groups of households may differ.

Person.—One person equals 21 meals at home. See "Household Size in Equivalent Meals at Home (Persons)." Average quantities and money value of food used per person by groups of households are per 21-meal-at-home-equivalent person.

Potato, fresh equivalent.—Weight of fresh whole potatoes plus weight of fresh pared, canned, frozen, and dried potatoes, and potato chips, soup, and salad converted to equivalent weight of fresh potatoes with skin. Source of most factors: "Conversion Factors for Agricultural Commodities" (6).

Recommended Dietary Allowances.—Daily allowances for food energy and seven nutrients recommended by the Food and Nutrition Board, National Academy of Sciences-National Research Council, as normally desirable goals in planning practical diets (3).

The recommended allowances are judgments of nutrition experts who consider them, except for calories, well above minimal requirements but not necessarily optimal levels of intake. The margin over minimal requirements varies widely among nutrients. Two-thirds of the allowance has been considered in this and other household surveys of the Department as a level below which diets could be nutritionally inadequate for some individuals over an extended period of time. Height, weight, and other variables affect the nutrient requirements of an individual. Although the allowances do not constitute a precise tool for rating diets of persons or households individually, they do provide a satisfactory yardstick for evaluating diets of population groups. They also provide a tool for calculating nutrition units of households, which in turn permit comparison of nutrient content of food of households and groups of households dissimilar in composition.

Revisions of 1955 survey data.—Data on the nutritive value of food used and quality of diet published in "Dietary Levels of Households in the United States" (4) are not comparable with data from the spring 1965 survey in several respects. (1) Food composition tables used to compute nutritive values of diets were revised after the 1955 tabulation to reflect later research in nutrient content of foods. (2) Nutritive values of diets tabulated for 1955 did not include values for some items such as baking powder, coffee, and alcoholic beverages. These values were included in the 1965 study. (3) Diets in 1955 were evaluated using Recommended Dietary Allowances set in 1953 by the Food and Nutrition Board of the National Research Council as modified for application to dietary surveys by LeBovit and Stiebeling (1), and diets in 1965 were evaluated using allowances set in 1963.

Average nutritive values per person per day for diets of households in the spring of 1955 shown in the section on Results of this report were adjusted to reflect revisions in values in food composition tables and to include values for additional food items.

To determine the percentage of household diets in 1955 that were below the 1963 allowances, nutritive values of diets and household size in nutrition units for each household would need to be recomputed. To recompute these values was not

feasible. Instead, households in 1955 with diets that were below 1963 allowances and below two-thirds of the allowances were estimated as follows:

Calcium, thiamine, and riboflavin: (1) The average nutrient content of food used in each region and in each urbanization was revised to reflect changes in values in food composition tables made between the 1955 and 1965 surveys and to include nutritive values for alcoholic beverages, coffee, and baking powder. (2) The average number of nutrition units in each region and in each urbanization was recomputed using 1963 allowances. (3) The cumulative curve of the distribution of households by the amount of the nutrient per nutrition unit as computed in 1955 was shifted to account for the average change in the nutrient content of food and the number of nutrition units. (4) An adjusted percentage of households not meeting the allowance was read from the curve at the level of the 1963 allowance for the 25-year-old man. In this method the changes are prorated to each household in proportion to values as computed in 1955. This method of adjustment is appropriate only for nutrients for which the percentage change in allowances from those used in the 1955 survey to those used in the 1965 survey is similar for all age-sex groups and therefore for all households.

Protein, iron, vitamin A value, and ascorbic acid: (1) For each of the four nutrients, a pattern from the 1965 data was determined. An equation was derived using region, urbanization and average nutrient content of food used (per nutrition unit) for a group of households as indicators of the proportion of those households not meeting the recommended allowance. (2) The average nutrient content per nutrition unit as of 1955, revised according to steps (1) and (2) in the preceding paragraph, was substituted into the equation to derive an adjusted percentage of households not meeting the allowance. This method was limited to nutrients for which the 1955 revised average nutritive value was within the limits of observed values in 1965.

Revisions in percentage of households with diets below allowances of one or more nutrients were made as follows:

- (1) An equation was derived from the 1965 data using region, urbanization, and percentage of households with diets not meeting allowances in each of the seven nutrients as indicators.
- (2) Revised 1955 percents for the seven nutrients were substituted into the equation to derive an adjusted percent for one or more nutrients.

In general, the methods of collecting and tabulating the data on quantity and money value of food used in the 1955 and 1965 surveys were the same. Some differences that might affect comparability are described in detail in HFCS 1965-66 Report 1 (5, pp. 202-204).

Rural farm.—See "Urbanization."

Rural nonfarm.—See "Urbanization."

Sample design and analysis.—See HFCS 1965-66 Report 1 (5, pp. 204-208).

Spring.—The months of April, May, and June.

Sugar equivalent.—Weight of sugar, sirup, jellies, and candies plus approximate sugar content by weight for selected foods high in sugar—liquid soft drinks; fruit ades, punches, drinks, nectars; dry pudding mixes; ready-to-eat gelatin dessert; and cake icing.

Survey week.—The continuous 7-day period just before the interview during which the reported food was used. An interview that occurred on Monday morning after breakfast, for example, covered the period from Monday morning a week earlier after breakfast to the interview time.

Urban.—See "Urbanization."

Urbanization.—Distinction between urban and rural households was based on the size of place in which the dwelling was located. Within the rural category, distinction between farm and nonfarm households was based on the presence of a farm operator. Definitions are those used by the Department of Commerce for the Population Census (1950) and the Agriculture Census (1964).

All households: Composite or urban, rural nonfarm, and rural farm households appropriately weighted.

Urban: Households in places with at least 2,500 inhabitants and in closely settled fringe areas surrounding cities of 50,000 or more inhabitants.

Rural nonfarm: Households outside of urban places without a farm operator.

Rural farm: Households outside of urban places with a farm operator.

A farm operator was a person who at the time of the interview made decisions and controlled the operation of property consisting of (1) 10 or more acres yielding sales of at least \$50 in 1964 or (2) fewer than 10 acres yielding sales of at least \$250 in 1964 or (3) land expected to yield sales in 1965 meeting either

of those specifications. The farm operator performed the labor himself or directly supervised it. He was an individual operator or had one or more partners and either owned or rented the property by cash or cropping arrangements. The operator's dwelling unit did not have to be located on the farm property.

SURVEY REGIONS

Classification of conterminous States as defined by the 1960 Census follows:

Northeast			South		
Connecticut	New Hampshire	Pennsylvania	Alabama	Georgia	Oklahoma
Maine	New Jersey	Rhode Island	Arkansas	Kentucky	South Carolina
Massachusetts	New York	Vermont	Delaware	Louisiana	Tennessee
North Central			District of Columbia	Maryland	Texas
Illinois	Michigan	North Dakota	Florida	Mississippi	Virginia
Indiana	Minnesota	Ohio		North Carolina	West Virginia
Iowa	Missouri	South Dakota	West		
Kansas	Nebraska	Wisconsin	Arizona	Montana	Utah
			California	Nevada	Washington
			Colorado	New Mexico	
			Idaho	Oregon	Wyoming

Alaska and Hawaii are not included in this study.
